****The student shall register and complete the project based online course preferably in semester- I but may complete the same till the end of semester-II.**

PEIN 4201: Program Elective-I

A. Process Modelling and Optimization

B. Digital Control

C. Building Automation

D. Power Plant and Safety Instrumentation

OE 4201: Open Elective-II

A. Instrumentation in Agriculture and Food Industry

B. Advanced Digital Signal and Image Processing

C. System On Chip

IN 4201: Process Data Analytics

Teaching Scheme
Lecture: 3 Hr/Week

Examination Scheme
In Semester: 50 Marks
End Semester:50 Marks
Credit: 3

Prerequisite: Concepts of Mathematics and Computational techniques

Course Objectives:
1. To explore the statistical analysis techniques for various kinds of data.
2. To understand the concepts and types of Artificial Intelligence and Machine Learning Algorithms.
3. To be familiar with a set of well-known supervised, semi-supervised and unsupervised learning algorithms.

Course Outcomes: The student will be able to
1. apply standard statistical inference procedures to draw conclusions from data analysis.
2. list and define the basic concepts of artificial intelligence and machine learning.
3. compare and select various machine learning algorithms for solving practical problems.
4. implement various machine learning algorithms to different domains.

Unit 1: Introduction to statistical analysis **(07)**
Statistical Analysis, introduction, methods, definitions Descriptive Statistics, Probability distributions Inferential Statistics, Two Sample Tests, Type 1 and Type 2 Errors Inferential Statistics through hypothesis tests, Permutation & Randomization Test ANOVA and Test of Independence

Unit 2: Regression Analysis and related tools **(07)**
Introduction, Methods, Types. Linear and Multiple Regression Methods Regression : Ordinary Least Squares, Ridge Regression, Lasso Regression, K Nearest Neighbours Regression & Classification ANOVA and Test of Independence Introduction to R and Python programming Introduction to Advanced Pattern Recognition

Unit 3: Introduction to Artificial Intelligence and Machine Learning **(07)**
Introduction to machine learning and concepts and comparison with biological intelligence. Differentiating algorithmic and model based frameworks. Introduction to Neural Networks and Fuzzy Logic as techniques for Machine Learning

Unit 4: Supervised Learning Methods **(07)**
Bias-Variance Dichotomy, Model Validation Approaches, Logistic Regression, Linear Discriminant Analysis, Quadratic Discriminant Analysis, Regression and Classification Trees, Support Vector Machines, Deep Learning

Unit 5: Unsupervised Learning Methods **(07)**
Clustering, Associative Rule Mining, Introduction to Big Data and Challenges for big data analytics

Unit 6: Classifiers **(07)**
Cases Studies of Classifiers implemented by various methods for applications in the field of Process Industry, Biomedical Field, Network domain and similar other domains

PEIN 4201(A): Process Modeling and Optimization

Teaching Scheme
Lecture: 3 Hr/Week

Examination Scheme
In Semester: 50 Marks
End Semester: 50 Marks
Credit: 3

Prerequisite: Process Instrumentation , Automatic Control System, Control system Design

Course Objectives:
1. Understand and develop system's mathematical models.
2. Learn the use of Numerical methods in solving the model equations.
3. To learn to various optimization techniques.

Course Outcomes: The student will be able to
1. define and list types of mathematical models.
2. develop mathematical model of process.
3. simulate and analyze the system performance.
4. apply the optimization techniques and analyze the results.

Unit 1: Modeling Aspects & Mathematical Models **(06)**

Definition of process model, physical and mathematical modeling, deterministic and stochastic process. Introduction, uses of mathematical models, classification of mathematical methods, scope of coverage, principles of formulation, fundamental laws, continuity equations, energy equations, equation of motion, transport equation, equation of state, equilibrium, kinetics

Unit 2: Mathematical Modeling of Mechanical & Chemical Engineering Systems **(06)**
Process models of some typical systems in differential equations form, , dead time, first and second order models, higher order models, Behaviour of firt order and second order system

Unit 3: Mathematical Models **(06)**
Mathematical Models of Tanks in series, Tanks in parallel Reaction dynamics, Modeling the chemical reactions, CSTR models, Plug flow reactor model, modeling of flash drum, distillation columns, evaporators, dryers, heat exchangers.

Unit 4: Basic concept of Optimization **(06)**
Optimization: Concept, need, Essential features of optimization Problem, Concepts of objective functions, Equality and Inequality Constraints, Payback period, Return of Investment, Net present Value, Internal Rate of Return. Classification of optimization problem based on Existence of constrains, Nature of design variables, Physical Structure of the problem, Equation Involved, Permissible values, of design variable, Deterministic Nature of the variables, separability of the variable, Number of objective functions. Continuity of functions, Convex and Concave functions, Convex Region, Extremum of the objective functions, quadratic approximation, Feasible region.

Unit 5: Optimization of Unconstrained Functions & Linear Programming **(06)**
One-Dimensional search numerical methods for optimizing a function of one variable , scanning and bracketing procedures, Newton, Quasi-Newton and Secant methods,Runge Kutta method.

Unit 6: Unconstrained Multivariable Optimization **(06)**
Simplex method, Direct Methods, Indirect

Methods, Steepest Descent method.
Linear Programming : Basics of Linear Programming, Simplex Algorithm

Text Books:

1. W. L. Luyben, Process, Modeling, Simulation and Control for Chemical Engineers• by McGraw Hill, 1973.
2. Thomas Edgar, David Himmelblau, Optimization of Chemical Processes• Second edition, McGraw Hill, 2001.

Reference Books:

1. W. F. Stoecker, Design of Thermal Systems International Education, McGraw hill 1989.
2. J. Malley, Practical Process Instrumentation and Control • McGraw Hill.
3. Deo Narsingh ,System Simulation with digital Computer • Prentice Hall India, New Delhi.

PEIN 4201(B): Digital Control

Teaching Scheme
Lecture: 3 Hr/Week

Examination Scheme
In Semester: 50 Marks
End Semester: 50 Marks
Credit: 3

Prerequisites: Basics of Control System

Course Objectives:

1. To learn and understand control system design.
2. Design various digital controllers and study the response of those controllers.
3. To learn and understand stability of system in z-plane.
4. Introduce optimal control design and it's need.

Course Outcomes: The student will be able to
1. analyze system design in various planes S-W-Z and its mapping.
2. analyze stability of a system in S-plane and Z-plane
3. design and analyze system using classical method and state space.
4. design optimal control for a discrete system.

Unit 1: Introduction to Discrete Time Control System **(06)**
Basic building blocks of Discrete Time Control system, Sampling Theorem, Choice of Sampling Rate and Multirate Sampling, Z Transform and Inverse Z Transform for applications for solving Differential Equations, Impulse Sampling, Reconstruction: Data Hold, Mathematical Model of Zero Order Hold

Unit 2: Pulse Transfer Function and Digital Controllers **(06)**
The Pulse Transfer Function, Pulse Transfer Function of Open Loop and Closed Loop Systems, Pulse Transfer Function of Digital PID Controller, Velocity and Position forms of Digital PID Controller, Deadbeat Response and Ringing of Poles, Design of Deadbeat Controller.

Unit 3: Stability Analysis of Discrete Time Control System **(06)**
Stability regions in S-plane, W-plane and Z-plane and Mapping between the three planes, Stability Tests for Discrete System, Jury Stability Criterion, Bilinear Transformations.

Unit 4: Design of Discrete Time Control System- State Space Approach **(06)**
Different Canonical forms, Relation between State Equations and Pulse Transfer Function, Solution of Discrete Time State Space Equations, Cayley-Hamilton Theorem, Discretization of Continuous Time State Equation, Pulse Transfer Function Matrix, Eigen Values, Eigen Vectors and Matrix Diagonalization.

Unit 5: Pole Placement and Observer Design **(06)**
Concept of Controllability and Observability, Pole Placement Design by State Feedback, Design of feedback gain matrix using sufficient condition, Ackerman's formula, State Observers Types.

Unit 6: Introduction to Optimal Control **(06)**
Basics of Optimal Control, Performance Indices, Quadratic Optimal Control and Quadratic Performance Index.

Text Books:

1. Discrete Time Control systems by K. Ogata, Prentice Hall, Second Edition,2003.
2. Digital Control and State Variable Methods by M. Gopal, Tata McGraw Hill, 2003.
3. Digital Control by Kannan Moudgalya, John Wiley and Sons, 2007.

Reference Books:

1. Digital Control of Dynamic Systems by G.F.Franklin, J.David Powell, Michael Workman 3rd Edition, Addison Wesley, 2000.
2. Digital Control Engineering by M. Gopal, Wiley Eastern Ltd, 1989.
3. Digital Control by Forsytheand W. and Goodall R.N McMillan,1991.
4. Digital Control Systems by Contantine H. Houpis and Gary B. Lamont, 2nd Edition, McGraw-Hill International, 2002.

PEIN 4201(C): Building Automation

Teaching Scheme
Lectures: 3 Hr/Week

Examination Scheme
In Semester: 50 Marks
End Semester:50 Marks
Credit: 3

Prerequisite: Basics of Electronics and Instrumentation

Course Objectives:
1. To understand Buildigng automation systems
2. To understand the working of various Building automation components.
3. To learn the Building automation with applications.

Course Outcomes: The student will be able to
1. interpret and investigate the system requirements for BAS systems.
2. classify, compare and choose the suitable BAS systems for the applications.
3. articulate the purpose and operation of HVAC system components.
4. analyze and validate the design of BAS systems.

Unit 1: Introduction to Building Automation Systems **(07)**
Intelligent building, Intelligent architecture and structure, Facilities management vs. intelligent buildings, Lifecycle of building, Evolution of intelligent buildings. BAS System Hierarchy –Field level components, Direct Digital Control (DDC), Supervisory Controller, Server, Operator Workstation (OWS). Different systems in BAS which includes HVAC, security, fire, lighting systems. Importance of each system in BAS. Process of BAS design, Role of different stakeholders (Architect, contractor, consultant, application engineer and engineer) in BAS system design, Comfort parameters for human being- temperature, humidity, flow, pressure, clean air, CO2%.

Unit 2: Fire Alarm Systems I **(07)**
Introduction, Block diagram of FAS, Fire –Meaning, Fire Development Stages, Fire Sensors & Detectors, Detector Placement, Detectors Required For Various Applications, Notification appliances: types, specifications, installations guidelines. Fire Extinguishing Principles, Fire Extinguishers & Its Classification.

Unit 3: Fire Alarm Systems II **(07)**
FAS types and Architectures , FAS Loops and classification, comparision of loops, FAS Communication Protocols, Various Fire Standards, Power Supply and voltage drop Calculations, Cause & effect matrix.

Unit 4: Security Systems **(07)**
Introduction, Access Control – Concept, Generic Model, Components, Types, Features, Card Technologies, Communication Protocols, Controllers, Concept of Antipassback, Biometrics Systems: Issues With Biometrics, Need and Applications, components of biometric systems
CCTV Systems: Introduction, Applications, CCTV Camera types, Camera Basics, Types of CCTV Systems: Traditional and Advanced CCTV Systems, Video Recording, Drawbacks, Digital Video Recording, Features, Functionalities, Digital Vs Analog Recording, Digital Video Management System .

Unit 5: HVAC Water Systems **(07)**

Design, working of different types of chilled water system- single chiller system, series chiller system, parallel chiller system. Working of different components of chilled water system- decoupler line, bypass line, primary circuit, secondary circuit, and condenser pumps. Concept of free cooling- direct waterside, series waterside, parallel waterside free cooling.

Hot Water Systems: Concept of geothermal system, Working, design of different types of hot water system- with boilers, heat exchanger with steam input, heat exchanger with hot water input, geothermal system, solar system and combination of all listed systems.

Unit 6: HVAC Air Systems **(07)**

Concept of Air handling unit. Design, working of different components in AHU- damper, filter, cooling coil, heating coil, fan, heat recovery wheel, humidifier. Working, configuration, characteristics for different types of dampers. Damper Sizing, Design and working of different types of AHU. Operation of different modes.Concept of Variable Air Volume (VAV) system-Design, working, use of different types of VAV- CAV, Design, working, use of radiation coil, chilled beam, CRAC unit, VRV systems, unit heater, Fan coil unit and unit ventilator.

PEIN 4201 (D): Power Plants and Safety Instrumentation

Teaching Scheme
Lectures: 3 Hr/Week

Examination Scheme
In Semester: 50 Marks
End Semester:50 Marks
Credit: 3

Course Prerequisite: Basics of process control fundamentals, knowledge of Unit operations and basics of control strategies

Course Objectives:
1. To expose the students to the detail process of variuos types of power plants.
2. To impart knowledge on various measurements and instrumentation involved in variuos types of power plants.
3. To provide the knowledge on specific measurement techniques and control systems practiced in boiler and turbine units.

Course Outcomes: The student will be able to
1. identify the different unit operations, process control equipments involved in different types of power plants like thermal, nuclear and hydroelectric power plants
2. select appropriate measurement techniques for measurement of various process parameters involved in power plants
3. analyze and develop various control loops for processes involved in power plants
4. assess various automation tools to develop automation strategy to Thermal power plant

Unit 1: Introduction to thermal power plant **(07)**
Thermal power plant process: Coal and ash circuit, Air and flue gas circuit, Water and steam circuit, Water treatment plant, DM plant, cooling water circuit
Main equipments: Boiler, steam turbines, generator, boiler feed pump, condensate extraction pump, deaerator etc
Measurements in power plants and sensors used: Measurement of feed water flow, air flow, steam flow and coal quantity, drum level measurement, Steam pressure and temperature measurement, flue gas analyzer, fuel composition analyzers, flame monitoring, Turbine speed and vibration measurement

Unit 2: Boiler and Turbine Controls **(07)**
Boiler control: steam pressure control with load index, coal mill control, furnace draft control, drum-level controls, super heater temperature control, fuel/air ratio, oxygen, CO and CO_2 trimming, combustion efficiency, excess air, parallel and cross limited combustion control.
Turbine control: Turbine speed and load control, transient speed rise, automatic load frequency control, Turbine oil cooling system, Turbine run up system, Thermal stress control, Vibration, eccentricity, axial shift.
Instrumentation in Generator cooling systems, Generator control system

Unit 3: Application of DCS in Thermal power plant control **(07)**
Automation strategy, Automatic boiler control, diagnostic functions and protection, Electro-hydraulic governor system, Automatic startup system, Distributed control to improve reliability Need of condition monitoring systems, Fault tolerant control system in thermal power plants

Unit 4: Nuclear power plant (07)

Nuclear power plant method of power generation, Basic physics of nuclear reactors Atomic structure, isotopes, radioactivity, basics of fission reaction, moderation, criticality Components of nuclear reactor Radiation sources and protection safety objectives Rad-waste management Safety Practices in Indian NPPS, Radiological Protection to workers and public, Dose limits, Health physics

Unit 5: Nuclear power plant Instrumentation (07)

Control loops for different types of nuclear reactors, Process sensors for nuclear power plants for radiations detection, temperature measurement etc, Safety in nuclear power plant, reliability aspects

Unit 6: Hydroelectric power plant Instrumentation (07)

Hydroelectric power plant process, Types of water turbines, Governing system in water turbine of hydro power plant, Regulation & monitoring of voltage & frequency of output power, Electrical sub-station controls, SCADA solution to improve reliability, Safety system in hydro power, Pollution & effluent monitoring & control, Energy Management

Text Books:

1. Power Plant Instrumentation , K. Krishnaswamy, M. Ponnibala
2. Computer Based Industrial Control, Krishna Kant
3. Power Plant Engineering, Domkundwar
4. Power Plant Engineering, Manoj Kumar Gupta

Reference books:

1. Power Plant Instrumentation and Control Ajay Debnath, Swapan Basu Academic Press Elsevier
2. Process Control, Liptak
3. Boiler Control Systems, David Lindsley, Mc-Graw Hill
4. Power Plant Instrumentation and Controls, Philip Kiameh
5. G.F. Knoll, "Radiation Detection & Measurement", 2nd edition, John Wiley & Sons, 1998.
6. Energy Management Handbook: W.C. Turner
7. Pollution: M.N.Rao and H.V. Rao.

OE 4201 (A): Instrumentation in Agriculture & Food Industry

Teaching Scheme
Lectures: 3 Hr/Week

Examination Scheme
In Semester: 50 Marks
End Semester: 50 Marks
Credit: 3

Prerequisite: Basics of sensors and transducers, knowledge of Unit operations and basics of process control, PLC and pneumatic and hydraulic instrumentation

Course Objectives:
1. To know the scope of Instrumentation in agriculture field
2. To Know greenhouse, food packaging automation schemes
3. Understand sensors used in agriculture field and weather monitoring stations
4. To get acquainted with foof quality standards

Course Outcomes: The student will be able to
1. identify the different unit operations, process control equipments involved in different types of process industries
2. select appropriate measurement techniques for measurement of various process parameters related to soil, green house, Dam and agro-metrology
3. analyze and develop various control loops for processes involved in various food processing plants
4. assess various automation tools to develop automation strategy to Dam, Green house, food processing and packaging in accordance to various food standards

Unit 1: Introduction **(07)**
Necessity of instrumentation & control for agriculture, engineering properties of soil: fundamental definitions & relationships, index properties of soil, permeability & seepage analysis, shear strength, Mohrs circle of stress, active & passive earth pressures, stability & slopes, Sensors: introduction to sonic anemometers, hygrometers, fine wire thermocouples

Unit 2: Instrumentation in Process industry **(07)**
Flow diagram of sugar plant & instrumentation set up for it, flow diagram of fermenter & control(batch process), flow diagram of dairy industry & instrumentation set up for it, juice extraction control process & instrumentation set up for it

Unit 3: Instrumentation in Irrigation and Green house System **(07)**
Irrigation systems: necessity, irrigation methods: overhead, centre pivot, lateral move, micro irrigation systems, soil moisture measurement methods: resistance based method, voltage based method, thermal based method, details of gypsum block, irrigation scheduling, irrigation efficiencies, Application of SCADA for DAM parameters & control. Green houses & instrumentation: ventilation, cooling & heating, wind speed, temperature & humidity, rain gauge carbon dioxide enrichment measurement & control

Unit 4: Instruments in Agriculture **(07)**
Automation in earth moving equipments & farm equipments, implementation of hydraulic, pneumatic & electronics control circuits in harvesters cotton pickers, tractor etc. classification of pumps: pump characteristics, pump selection & installation. Agrometrological instrumentation weather stations, surface flux measurement, soil water content measurement using time-domain reflectrometery(TDR).

Unit 5: Food Processing (07)

Definition, Food quality measurement , food safety and standards bill 2005, central committee for food standards, Agmark, Bureau of Indian Standards, Codex Standards, recommended international code of hygiene for various products, Design consideration: cold storage, atmospheric controller and preservatives; biosensors.

Unit 6: Automation in Food Industry

Application of SCADA & PLC in food packing industry, Trends in modern food processing, Equipments for creating and maintaining controlled atmosphere.

OE 4202 (B): Advanced Digital Signal and Image Processing

Teaching Scheme
Lectures: 3 Hr/Week

Examination Scheme
In Semester: 50 Marks
End Semester: 50 Marks
Credit: 3

Prerequisites: Basics of Digital Signal and Digital Image Acquisition

Course Objectives:
1. To study concepts and properties of Multirate DSP.
2. To learn concepts of Adaptive Filters.
3. To learn basic concepts and enhancement technique of Digital Image.
4. To study various applications of digital image processing in biometrics.

Course Outcomes: The student will be able to
1. suggest the use of Multirate DSP
2. design and implement the adaptive filters.
3. apply concepts of Digital image processing for advanced systems.
4. apply various image enhancement techniques for real time applications.

Unit 1: Multirate digital signal processing **(06)**
Basic multirate operation (up sampling, down sampling), Efficient structures for decimation and interpolation, Decimation and interpolation with polyphase filters,Noninteger sampling rate conversion , Efficient multirate filtering Applications.

Unit 2: Stochastic Processes and Spectral estimation **(06)**
Introduction, WSS signals and linear systems, spectral factorization, models of stochastic processes Spectral estimation: Periodogramm-based nonparametric methods: Periodogram, Bartlett's method, Welch's method, Blackman-Tukey method. Parametric methods for power spectrum etimation: AR,MA and ARMA modeling.

Unit 3: Adaptive filtering **(06)**
Principles of Adaptive filtering , LMS and RMS Algorithms, Applications in noise and echo cancellation, Homomorphic Signal Processing , homomorphic system for convolution, properties of complex-spectrum, Applications of homomorphic deconvolution.

Unit 4:Fundamentals of Digital Image Fundamentals **(06)**
Digital image representation, fundamental steps in image processing, Elements of digital image processing systems, Image fundamentals: Gray, Colour and Black and white. Color image models : RGB, CMY, HIS, etc models. Various Image Format, Sampling and quantization, Relationship between pixels, Statistical parameters (w.r.t. DIP) : Mean, standard deviation, variance, SNR, PSNR etc.

Unit 5: Image Enhancement **(06)**
Enhancement by point processing, spatial filtering, enhancement in the frequency domain. Contrast intensification: linear stretching, non-linear stretching, histogram specification, low contrast stretching. Smoothing: Image averaging, mean filter, order statistics filter, edge preserving smoothing. Sharpening: High pass filtering, homomorphic filtering.
Image Transforms: Basic transformations, Perspective transformation, 2-D Transforms: Fourier transform, Discrete cosine transform, Short time Fourier transform, Gabor transform, Radon transform, SVD, Wavelet Transforms, Hough Transform, Watershed Transform

Unit 6: Image segmentation and Image Compression **(06)**

Segmentation: detection of discontinuities, edge linking and boundary detection, thresholding, region -oriented segmentation Representation and description: Representation schemes, descriptors, regional descriptors, pattern and pattern classes, Introduction Classifiers. Introduction to image compression.

OE 4201 (C): System On Chip

Teaching Scheme
Lectures: 3 Hr/Week

Examination Scheme
In Semester: 50 Marks
End Semester:50 Marks
Credit: 3

Prerequisite: Basics of MEMS
Course Objective: The students will,
1. study the various microfabrication processes and the materials used for microfabrication.
2. learn characterization of MEMS sensors like pressure and gas
3. understand the concept of micro fluidics and micro reactor

Course Outcome: The student will be able to
1. list and define the various microfabrication processes
2. compare and select the materials for micro fabrication
3. design and develop the engineering stages involved in MEMS sensor and microfludics
4. characterize the developed MEMS sensor

Unit 1: Microfabrication Process – Lithography **(06)**
Types of Lithography – photo, e-beam, X-ray; Soft Lithography

Unit 2: Microfabrication Process – Direct write, Pattern transfer **(06)**
Direct write – focused ion beam, Laser; Pattern transfer – etching types – wet and dry

Unit 3: Material used for Microfabrication **(07)**
Study of various materials used for micro fabrication – Si, GaAs, Si_3N_4, SiO_2, Au, Pt, Ti; Polymers – PMMA, PTFE, Polyaniline, SU8, Polystyrene, PDMS

Unit 4: Device Engineering I **(06)**
Pressure sensor, Gas sensor – Design, Material selection, Modelling

Unit 5: Device Engineering II **(07)**
Study of microfluidics – definition, techniques involved, advantages and applications; Study of micro reactor – definition, types

Unit 6: Characterization **(06)**
Various principles, tools and methods involved in characterization of MEMS sensors

Text Books:
1. Introduction to Microfabrication by Sami Franssila
2. Foundation of MEMS by Chang Liu 2nd Ed.
3. Fundamentals and Applications of Microfluidics by Nam-Trung Nguyen, Steven T. Wereley 2nd Ed.

Reference Books:
1. Microsystem Design by Stephen D. Senturia

IN 4202: Process Data Analytics Lab

Teaching Scheme
Practical: 2 Hr/week

Examination Scheme
Oral: 50 marks
Credit: 1

Prerequisite: Concepts of Mathematics and Computational techniques

Course Objectives:
1. To explore the statistical analysis techniques for various kinds of data.
2. To understand the concepts and types of Artificial Intelligence and Machine Learning Algorithms.
3. To be familiar with a set of well-known supervised, semi-supervised and unsupervised learning algorithms.

Course Outcomes: The student will be able to
1. apply standard statistical inference procedures to draw conclusions from data analysis.
2. analysis of data using various statistical methods.
3. develop programming logic for various machine learning algorithms.
4. implement various machine learning algorithms to process industries.

List of Experiments: (students are expected to perform any 8 experiments)
1. Introduction to linear and multiple regression function in MATLAB
2. Applying linear & multiple regression to process data from a typical process plant
3. Implement ANOVA for a database
4. Data Analysis using K nearest neighbour Regression
5. Introduction to programming in R
6. Linear regression in R
7. Implementation of Neural Networks for standard data set
8. Implementation of Fuzzy logic for classification of standard data set
9. Implement a classifier for application in field of process industry using data from a standard source

IN 4204: Project Phase II

Teaching Scheme
Tutorial: 2 Hr/Week
Practical: 16 Hr/Week

Examination Scheme
In semester: 100 Marks
Oral: 50 Marks
Credit: 10

Course Outcomes: The student will be able to
1. identify technical problem related to industry, healthcare, society, research organizations.
2. apply the achieved technical knowledge and skills to define the problem statement.
3. identify, design and implement the various stages involved in solving the defined problem statement.
4. test the designed stages to get the desired solution.

The students are expected to work in suitable size groups. The work contribution of each group member should be apporaching towards the final solution. The work should be completed in the stipulated time.
